SPACE IS LIMITED TO 25 PARTICIPANTS.

GREY-WATER & RAIN WATER HARVESTING

MARCH 21ST & 22ND

Brook Sarson, water harvesting professional, with H2OME (www.h2o-me.com), along with Daniel Francis, local permaculture designer and consultant, will walk you through a 865 gallon tank installation and a laundry to landscape grey-water installation.

Day 1: Learn the fundamentals of grey-water, including do's & don't's, materials needed, water budgeting, appropriate plantings, and legalities. We will be installing a simple, laundry grey-water system according to state regulations which will require no permit.

Day 2: Come learn about different rain storage options, important steps to remember when implementing any water harvesting strategies and how to use your stored water. We will be installing a 865 gallon rain water tank, and connect it to the rain-gutter system.

Each class will start with a site introduction, followed by an hour presentation on rainwater or grey-water harvesting strategies and considerations. Then we will discuss the specifics of our site, design, materials and install the system together.

After completing this workshop you will have enough information to either make an informed decision about what can be done at your own site by Brook, Daniel or other professional, or the confidence to install your own water tanks/grey-water system and access to resources to help you complete your project.

Brook Sarson and Daniel Francis are Water Harvesting experts and permaculture designers. They have been designing and installing systems for years. Brook has been educating people about simple, cost-effective rainwater and grey-water harvesting opportunities to help San Diego residents work towards water independence. Daniel has been teaching, designing and installing systems for long term food production, water conservation and ecological balance in Riverside.

Please bring your lunch. We will have snacks and water available. Closed toed shoes, pants, gloves, and a good sun hat are strongly recommended.
